

Beehive 1.0 -- Release Notes

Table of contents

1 Changes.....	2
2 Known Issues.....	2

1. Changes

This section lists changes from the last release that are not backward-compatible.

- The location for generated Struts (and Validator) XML configuration files has been moved. Previously, these files were created under `WEB-INF/.pageflow-struts-generated`. They are now generated into `WEB-INF/classes/_pageflow`. In most cases, this should not cause any back-compat problems, since the generated files are internal to the framework.
- The `weboutputdir` attribute on the `build-pageflows` macro (`/ant/bee-hive-tools.xml`) has been removed. This had been used to support generation of resources under `WEB-INF` (see above).
- The `classoutputdir` attribute on the `build-pageflows` macro (`/ant/bee-hive-tools.xml`) has been replaced with `destdir`, to line it up with the rest of the `build-*` macros (and `javac`).

Additional fixed issues can be found in JIRA [here](#).

2. Known Issues

The list of known issues can be found in JIRA [here](#).
